Description :

The GLT41116 is a 65,536 x 16 bit high-performance CMOS dynamic random access memory. The GLT41116 offers Fast Page mode, and has both BYTE WRITE and WORD WRITE access cycles via two $\overline{\text{CAS}}$ pins. The GLT41116 has symmetric address and accepts 256-cycle refresh in 4ms interval.

All inputs are TTL compatible. Fast Page Mode operation allows random access up to 256x16 bits, within a page, with cycle times as short as 18ns.

The GLT41116 is best suited for graphics, and DSP applications requiring high performance memories.

Notes:

- I_{CC} is dependent on output loading when the device output is selected. Specified $I_{CC(\text{max.})}$ is measured with the output open.
- I_{CC} is dependent upon the number of address transitions specified $I_{CC(\text{max.})}$ is measured with a maximum of one transition per address cycle in random Read/Write and Fast Page Mode.
- Specified $V_{IL(\text{min.})}$ is steady state operation. During transitions $V_{IL(\text{min.})}$ may undershoot to -1.0V for a period not to exceed 20ns. All AC parameters are measured with $V_{IL(\text{min.})} \geq V_{SS}$ and $V_{IH(\text{max.})} \leq V_{CC}$.

Notes

1. An initial pause of 100 μ s is required after power-up followed by any 8 $\overline{\text{RAS}}$ only Refresh or $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ Refresh cycles to initialize the internal circuit.
2. $V_{IH(min.)}$ and $V_{IL(min.)}$ are reference levels for measuring timing of input signals. Transition times are measured between $V_{IH(min.)}$ and $V_{IL(max.)}$, AC measurements assume $t_T = 3\text{ns}$.
3. Measured with an equivalent to 2 TTL loads and 100pF.
4. For read cycles, the access time is defined as follows:

Input Conditions	Access Time
$t_{RAD} \leq t_{RAD(MAX.)}$ and $t_{RCD} \leq t_{RCD(MAX.)}$	$t_{RAC(MAX.)}$
$t_{RAD(max.)} < t_{RAD}$ and $t_{RCD} \leq t_{RCD(MAX.)}$	$t_{AA(MAX.)}$
$t_{RCD(max.)} < t_{RCD}$	$t_{CAC(MAX.)}$

$t_{RAD(MAX.)}$ and $t_{RCD(MAX.)}$ indicate the points which the access time changes and are not the limits of operation.

5. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are non restrictive operating parameters. They are included in the data sheet as electric characteristics only. If $t_{WCS} \geq t_{WCS(min.)}$, the cycle is an early write cycle and the data output will remain high impedance for the duration of the cycle. If $t_{CWD} \geq t_{CWD(min.)}$, $t_{RWD} \geq t_{RWD(min.)}$ and $t_{AWD} \geq t_{AWD(min.)}$, then the cycle is a read-modify-write cycle and the data output will contain the data read from the selected address. If neither of the above conditions is satisfied, the condition of the data out is indeterminate.
6. t_{AR} , t_{WCR} , and t_{DHR} are referenced to $t_{RAD(max.)}$.
7. $t_{OFF(max.)}$ and $t_{OEZ(max.)}$ define the time at which the output achieves the open circuit condition and are not referenced to V_{OH} or V_{OL} .
8. $t_{CRP(min.)}$ requirement should be applicable for $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ cycle preceded by any cycles.
9. Either $t_{RCH(min.)}$ or $t_{RRH(min.)}$ must be satisfied for a read cycle.
10. $t_{WP(min.)}$ is applicable for late write cycle or read modify write cycle. In early write cycles, $t_{WCH(min.)}$ should be satisfied.
11. This specification is referenced to $\overline{\text{CAS}}$ falling edge in early write cycles and to $\overline{\text{WE}}$ falling edge in late write or read modify write cycles.
